

Erstellen eines eigenen Karten API Keys!

Warum das ganze?

Stick-It wird ohne Umsatz am Leben gehalten. Server, Speicher und auch der Kartenservice können deshalb nur bis zu einem bestimmten Punkt genutzt, da sonst Kosten anfallen würden. Um die Karten für sich selbst dennoch anzeigen zu können, kann jeder einen kostenlosen Account bei „Stadia Maps“ erstellen. Es werden dabei **keine Bezahlinformationen** hinterlegt; Für den Account wird nur eine E-Mail-Adresse benötigt. Um den Account mit Stick-It zu verbinden, kann die folgende Anleitung verwendet werden.

Wie das ganze?

1. Folgenden Link öffnen: <https://client.stadiamaps.com/signup/>
2. Auf „sign-up“ klicken, um einen Account erstellen.

The screenshot shows the sign-up form for Stadia Maps. It includes fields for 'Business name (not required)', 'Email*' (with the example 'lr.dev.projects@gmail.com'), 'Password*', and 'Verify Password*'. A blue 'Sign up' button is at the bottom.

3. Beliebigen Namen eintragen, um ein „Property“ zu erstellen und auf „Create“ klicken.

Create a Property

Properties are a way to segment and authorize API usage. They could represent websites, apps, or anything else you want to spice up with a little geospatial awareness.

Usage statistics are available per property, but for billing purposes, everything on your account is aggregated under one easy subscription. Don't worry—you can create as many properties as you want!

Tip You don't need to create a property for local development on `localhost` or `127.0.0.1`.

Property Name

sticker-it

A descriptive name of the property (hint: you could use your domain name or the name of your app)

Create

4. Auf „Add API Key“ klicken.

Authentication Configuration

+ Add Domain

Domains should be used anytime you want your display a map in a web application. We use multiple methods to ensure requests are coming from users on your domain. This method is generally preferable to using API keys, since it is easier, and there is no risk of someone stealing your key. Note that development from 127.0.0.1 or localhost does not require setting up a domain; these requests will "just work."

+ Add API Key

API keys should be used in mobile apps or desktop applications not accessed through a web browser. API keys should be protected. While keys cannot be used to compromise your account, anyone with access to your API key could use it to make requests on your behalf and these requests would count against your quota.

5. API Key kopieren

API Key:

58eab548

API keys should be used in mobile apps or desktop applications not accessed through a web browser. API keys should be protected. While keys cannot be used to compromise your account, anyone with access to your API key could use it to make requests on your behalf and these requests would count against your quota.

Delete API Key

6. In Stick-It wechseln und in den Einstellungen

- a. „Edit Map“ öffnen
- b. Kopierten API-Key eingeben und mit „Submit Changes“ bestätigen
